Getting the file name of downloaded video using yt-dlp

if you want to get the filename:

```python
import subprocess
someFilename = subprocess.getoutput('yt-dlp --print filename https://www.youtube.com/something')
# then pass someFilename to FFmpeg
```

to use your own filename:

```python
subprocess.run('yt-dlp -o thisIsMyName https://www.youtube.com/something')
# this will likely download a file named thisIsMyName.webm
```

but if you are not sure of the file type/extension beforehand and just want to get that:

```python
someFileType = subprocess.getoutput('yt-dlp --print filename -o "%(ext)s" https://www.youtube.com/something')
print(someFileType)
```
